COVER: Lipid body imaging by wet scanning electron microscopy within a human blood eosinophil. Lipid bodies appear as highly contrasted round, bright organelles in conjunction with numerous eosinophil specific granules (non-bright, round structures). Cells were stained with osmium followed by uranyl acetate for imaging at scanning electron microscopy under fully hydrated conditions. (See Melo et al., p. 2589)

 The online version of this article contains supplemental material.

- 2451 **The mechanism mediating the activation of acetyl-coenzyme A carboxylase- α gene transcription by the liver X receptor agonist T0-901317**
Saswata Talukdar and F. Bradley Hillgartner
- 2462 **Dihydroxydocosahexaenoic acids of the neuroprotectin D family: synthesis, structure, and inhibition of human 5-lipoxygenase**
Igor A. Butovich, Svetlana M. Lukyanova, and Carl Bachmann
- 2475 **Protective effect of apolipoprotein E2 on coronary artery disease in African Americans is mediated through lipoprotein cholesterol**
Erdembileg Anuurad, Jill Rubin, Guijing Lu, Thomas A. Pearson, Steve Holleran, Rajasekhar Ramakrishnan, and Lars Berghund
- 2482 **ChREBP binding to fatty acid synthase and L-type pyruvate kinase genes is stimulated by glucose in pancreatic β -cells**
